Patrick,

Thanks for getting back to me quickly amongst your busy schedule. FYI, PCB levels for the congener samples range from 0.2 to 0.8 mg/kg (not the highest), so I simply stated that these samples were collected from areas with known PCB impacts.

Peter, I am working from home today and can be reached at Ex. 6 Personal Privacy (PP) you like to discuss.

Thanks, CY

Good Afternoon CY,

Thanks for your e-message & voicemail message. I am away from my office for field commitments today as well.

I have examined the proposed language regarding potential health impacts associated with compounds with dioxin-like activity and have no additional comments to add at this time.

I did want to share that although our current RSL for dioxin is 4.5 ppt - we do not use that concentration as a cleanup level because of the (soil) background issues that you articulated in the proposed response. We too, develop a site-specific TEQ analytical framework to evaluate the risk/hazard of all compounds with dioxin-like activity & then contrast that TEQ concentration with an EPA HQ policy-derived TEQ cleanup level.

The other point that is important to consider is that Kathy prioritized collection of samples for co-planar congener analysis at specific site locations with highly-elevated PCB soil findings. As you know, this strategy was pursued to increase the likelihood of locating unacceptable levels of dioxin-like congeners at the Ag Park site.

I will re-examine Kathy's congener data set when I return to the office to confirm.

Please disregard my last email, and here is an updated version with a few minor additions for your review.

Thanks, CY
